

## World Book Week activity Tuesday:

### **Water and air pollution and recycling**

One of the most important things we can do to help the environment and the planet is to recycle items that we can. When we make new things in big factories the smoke that comes out of the chimneys goes straight into the air and most of the time the smoke is really bad for the environment and makes our earth feel a little bit sad. But by recycling we can use things again and again and again which means we don't need to make new! This really helps keep our air a little cleaner and makes our earth feel happy again.

Please complete the recycling sorting task (answers are provided as some could go in more than one bin). Can you pick a recycling bin to focus on and create a poster detailing what can go in that bin? Example (Miss Nicholson will show you one she has made during today's video):
